Preface

This is the fourth issue of the Statistical Abstract published by the Office of Planning and Statistics. Data in this Abstract refer to the calendar year 1988. Whenever it refers to Fiscal Years, it is clearly indicated.

The sections on Population, Social Framework and Employment are more comprehensive than previous Abstracts, due to information from the 1988 Census of Population and Housing. Action is being taken to improve the Abstract further, though. Certain subject areas like National Accounts, Registration of Deaths and Public Safety are yet to be improved.

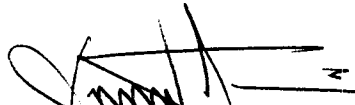

The production of this Abstract has been made possible by the invaluable contributions received from various government ministries, departments and other government agencies, private agencies and individuals. Without their assistance and cooperation past, present and future publication would not be possible. We wish to extend our sincere gratitude to all of them for their assistance.

This Abstract was prepared by Mr. H.J. Riggers, Associate Expert Statistician in UNDP/UNDTCD Planning Project TTP/401/89 and Messrs. Teruo Kaminaga and Caster Konou, Assistant National Statisticians. Mrs. Marciana Lolin, Administrative Officer, Ms. Tarina Jokon and Ms. Netha Jack, Clerk/Typists gave administrative support in preparing this document. We wish to thank all these officers and Dr. H.M. Gunasekera, Chief Technical Adviser of UNDP/UNDTCD Planning Project for their valuable contributions.

We need reliable and up-to-date information to plan the future of our country. As such, any assistance in this regard would be a valuable contribution to improve the living standards of the people of the Marshall Islands.

Where,

l_x : the probability of surviving from birth to exact age x. The value of l_x is always between 0 and 1. It is conventional practice, though, to express the l_x values per 1,000, especially in the construction of life tables where l_x is also interpreted as the number of persons of exact age x.

${}^n m_x$: central death rate, specific by age.

${}^n q_x$: probability of dying between ages x and x+n.

${}^n L_x$: person years lived by the cohort as it ages from age x to x+n.

$\frac{{}^5 L_{x+5}}{l_x}$: five year survival ratios

T_x : person years lived by the cohort from age x onward.

e^*_x : expectation of life at age x.
